<sup>a</sup>NO: no leaf removal; MED: post-fruit set removal of leaves to medium extent; HIGH: post-fruit set removal of leaves to high extent; P-B: pre-bloom removal of six basal leaves and laterals; post-fruit set sample was included in the mean, but not in statistical separation analysis.

<sup>b</sup>Lutein 5,6-epoxide and zeaxanthin were below the detection threshold (nd) in the Harvest sample. When detected, zeaxanthin ranged from 0.0091 to 0.0137 µg/g berry across treatments.

<sup>c</sup>Means in the same treatment group (columns) not sharing the same letter are significantly different at  $p > 0.05$  based on adjusted  $p$ -values using Tukey's honest significant difference.

<sup>d</sup>Does not include post-fruit set sample.

<sup>e</sup>NPS: normalized phenological stage. The post-fruit set sample could not be compared with others statistically because the post-fruit set sample was analyzed as a combination of east-west data while the rest were analyzed separately by canopy side.

<sup>f</sup>n/a: Zeaxanthin:lutein ratio unable to be determined, as zeaxanthin not detected at harvest.

<sup>g</sup>Significance of treatment effects ( $p > F$ ; ns: not significant at 0.05 level).
